

Figure 6. Map showing streamflow drainage for areas draining at least 1000 pixels (10 square km). The streamflow pattern shows the drainage into the Hudson Canyon from the northeast, the down-slope drainage along the mass-transport pathways to the southwest of Hudson Canyon, and downslope drainage characterized by numerous individual pathways on the lower rise. The unnaturally straight northeast-southwest trending streamflows that run parallel to the ship track, especially noticeable in the southwest corner of the map, result from errors in the multibeam data at the outer edges of the swaths.
